Problem Opportunity

Shopify is a platform where over 5 million merchants choose to conduct their business, selling products from physical goods to digital assets and anything in between. However, in order to participate in the \$500 billion subscriptions based product market, merchants rely on third party apps to create and manage selling plans. Such apps rarely attempt to prevent and analyze churn, the cancellation of shoppers' subscriptions. This oversight leaves gaps in merchants' ability to effectively manage their subscriptions business.

Solution

Subscriptions Flow AI aims to prevent churn by offering shoppers personalized offers prior to cancellation. The app also empowers merchants with churn insights to gain a better understanding of the health of their subscriptions based products.

Process

Subscriptions Flow AI was developed in bi-weekly iterative agile sprints using GitHub projects.

Project Evolution

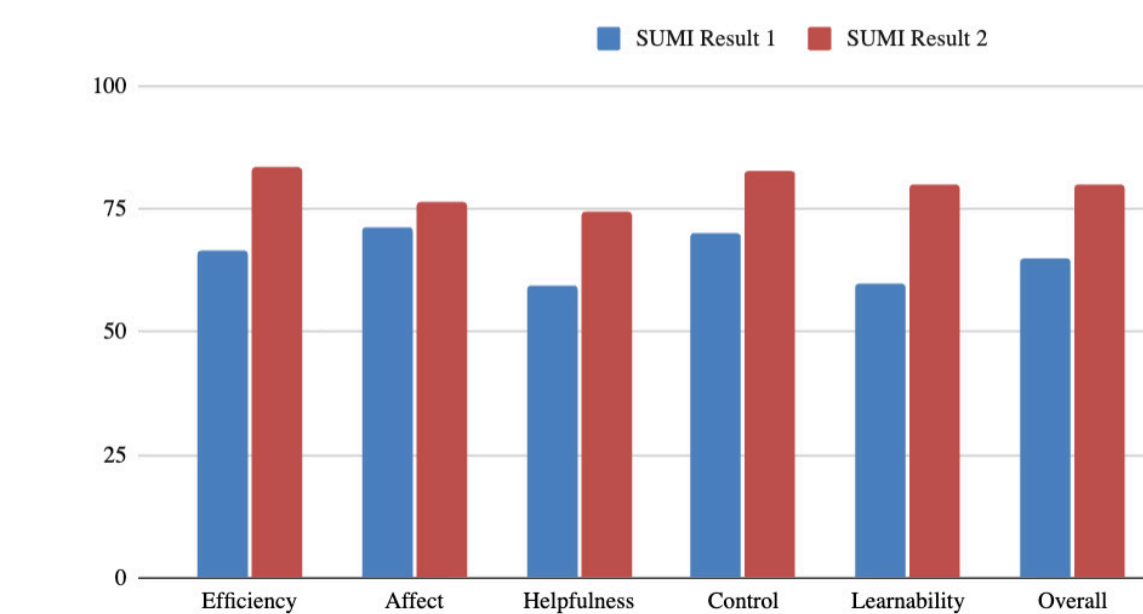

Subscription Creation

Created home page to showcase all possible templates. (Sprints 1-3)

Rendered configured UI template to customer checkout experience. (Sprints 7-9)

Created subscription creation form with UI template configurations. (Sprints 4-6)

Metrics

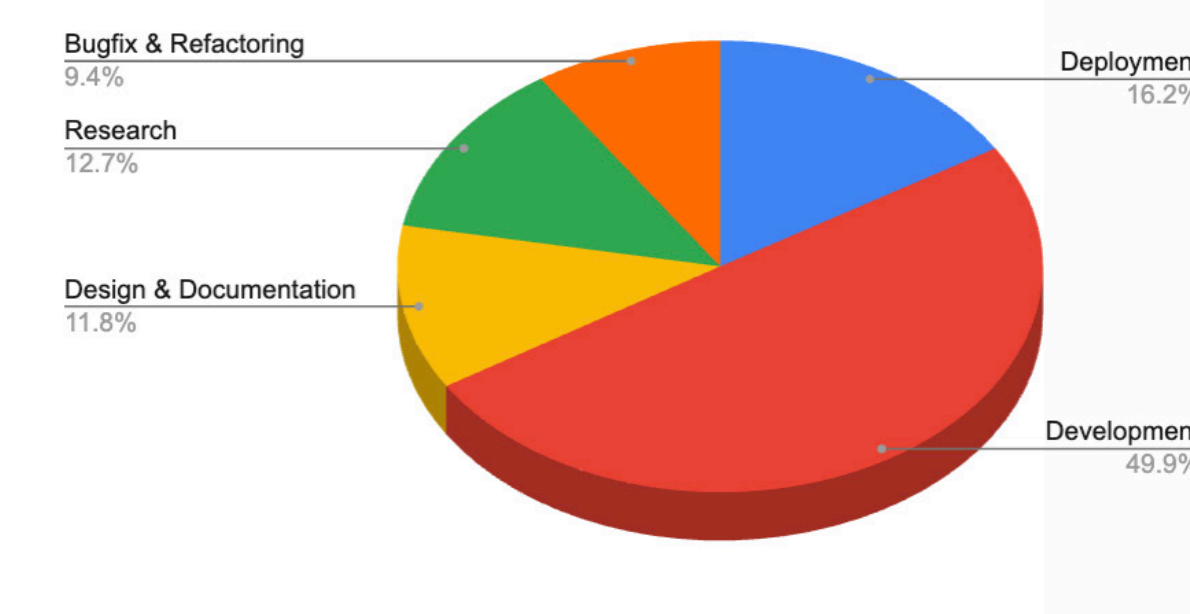

SUMI Survey Score

The SUMI survey was administered twice to the same four participants. The column chart compares the results from the first and second surveys. After the initial survey, the app was refined based on user feedback, and targeted improvements were made to enhance usability.

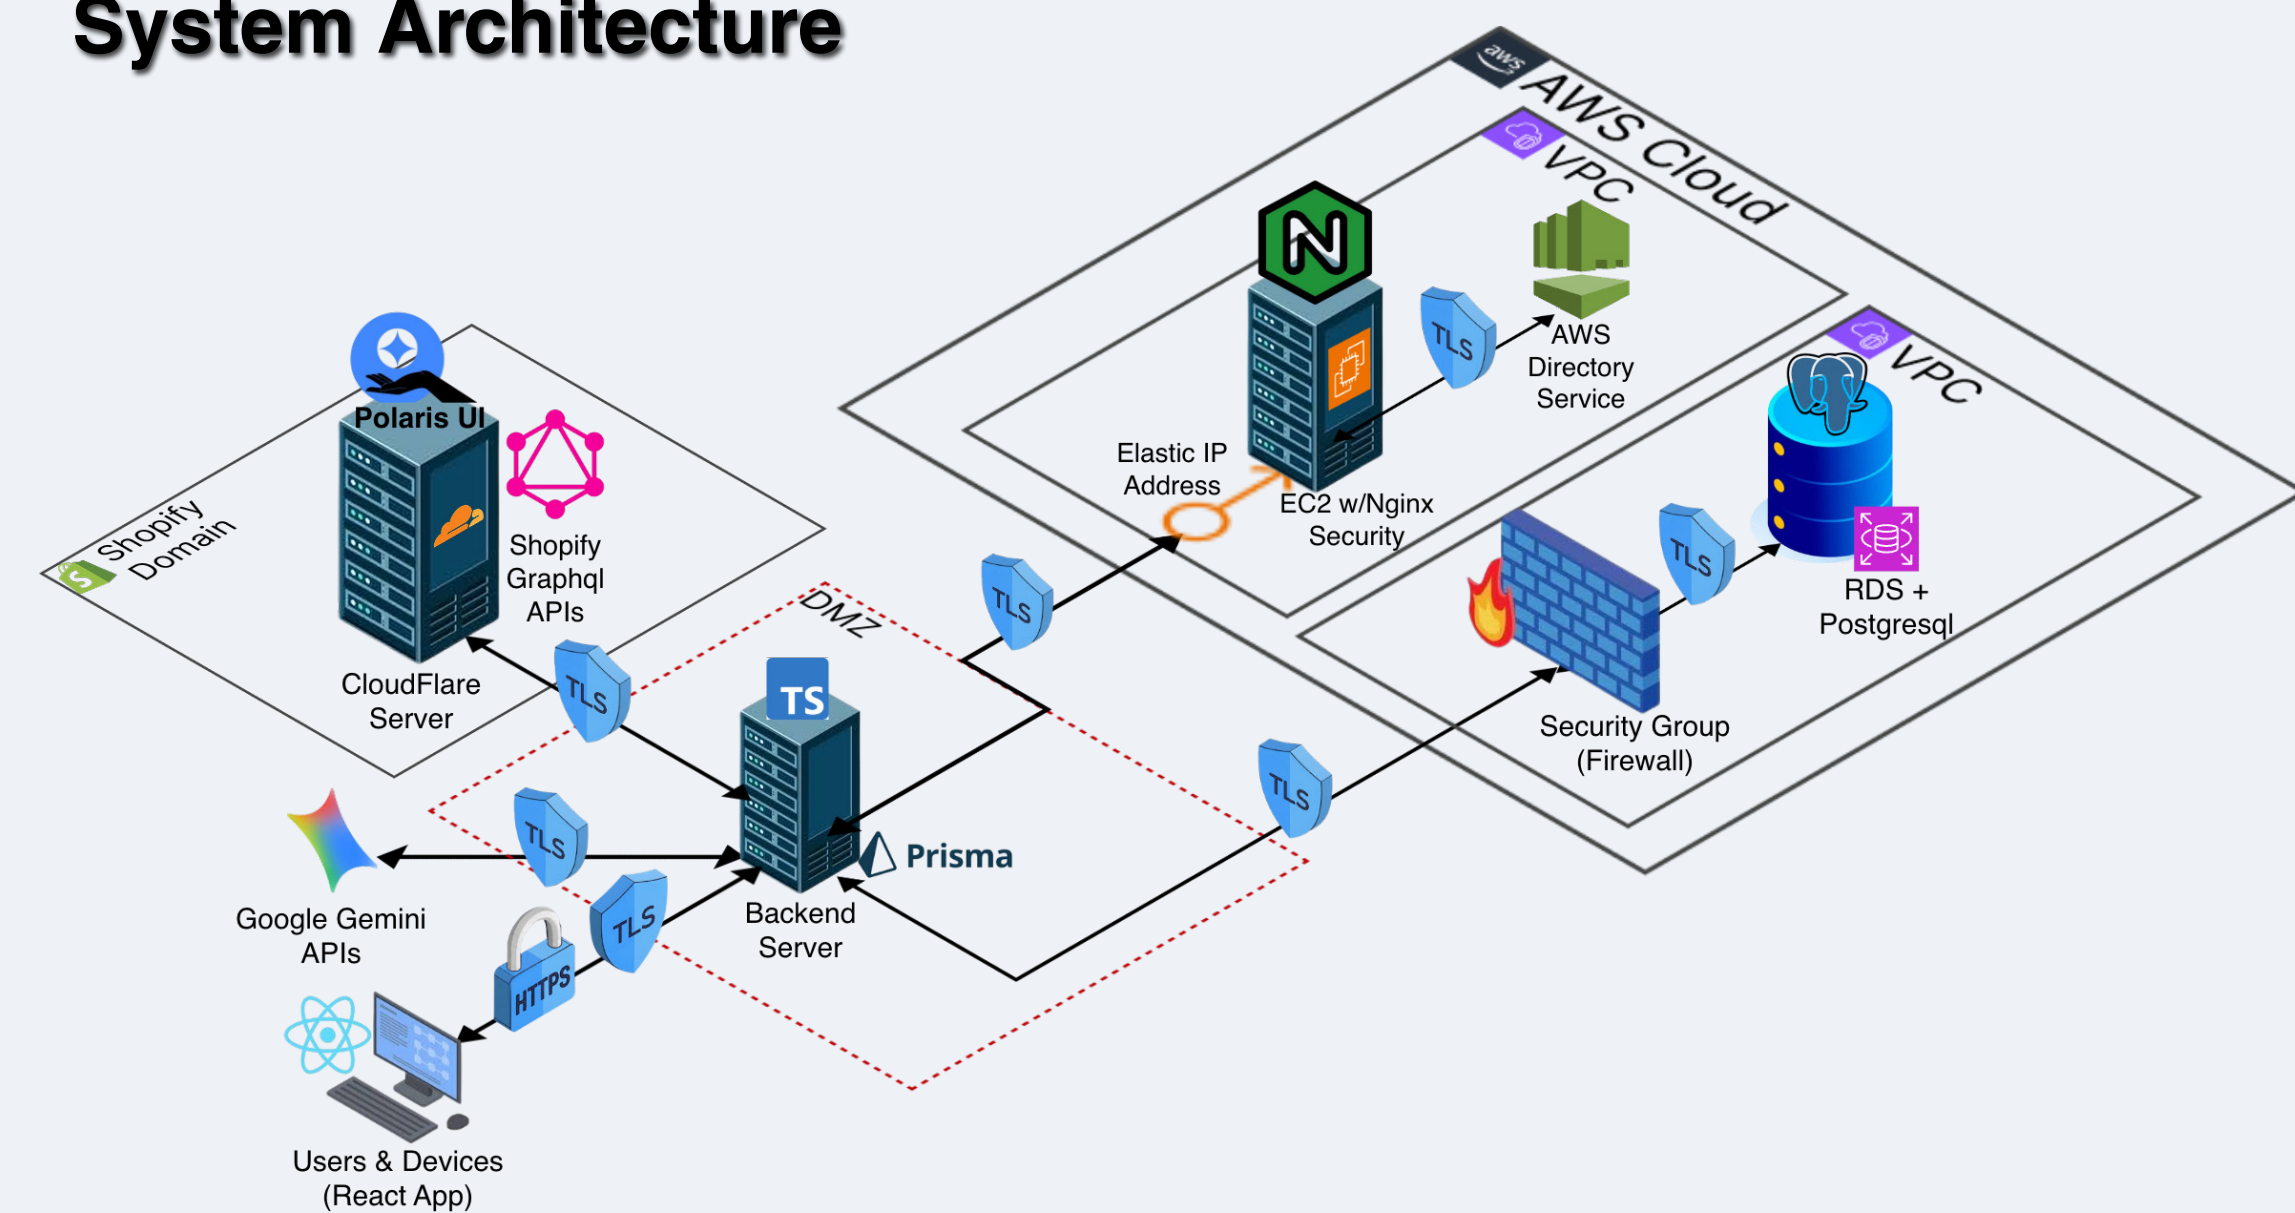

Effort By Type

Development (49.9%) and Deployment (16.2%) dominated due to the team's unfamiliarity with Shopify and GraphQL, requiring significant learning and iteration. Research (12.7%) reflects the groundwork needed before efficient implementation could begin. Deliberate attention was also given to Design & Documentation (11.8%) and Bugfix & Refactoring (9.4%), ensuring thoughtful UI decisions and up-to-date project artifacts throughout.

Distribution of Hours by Activity Type

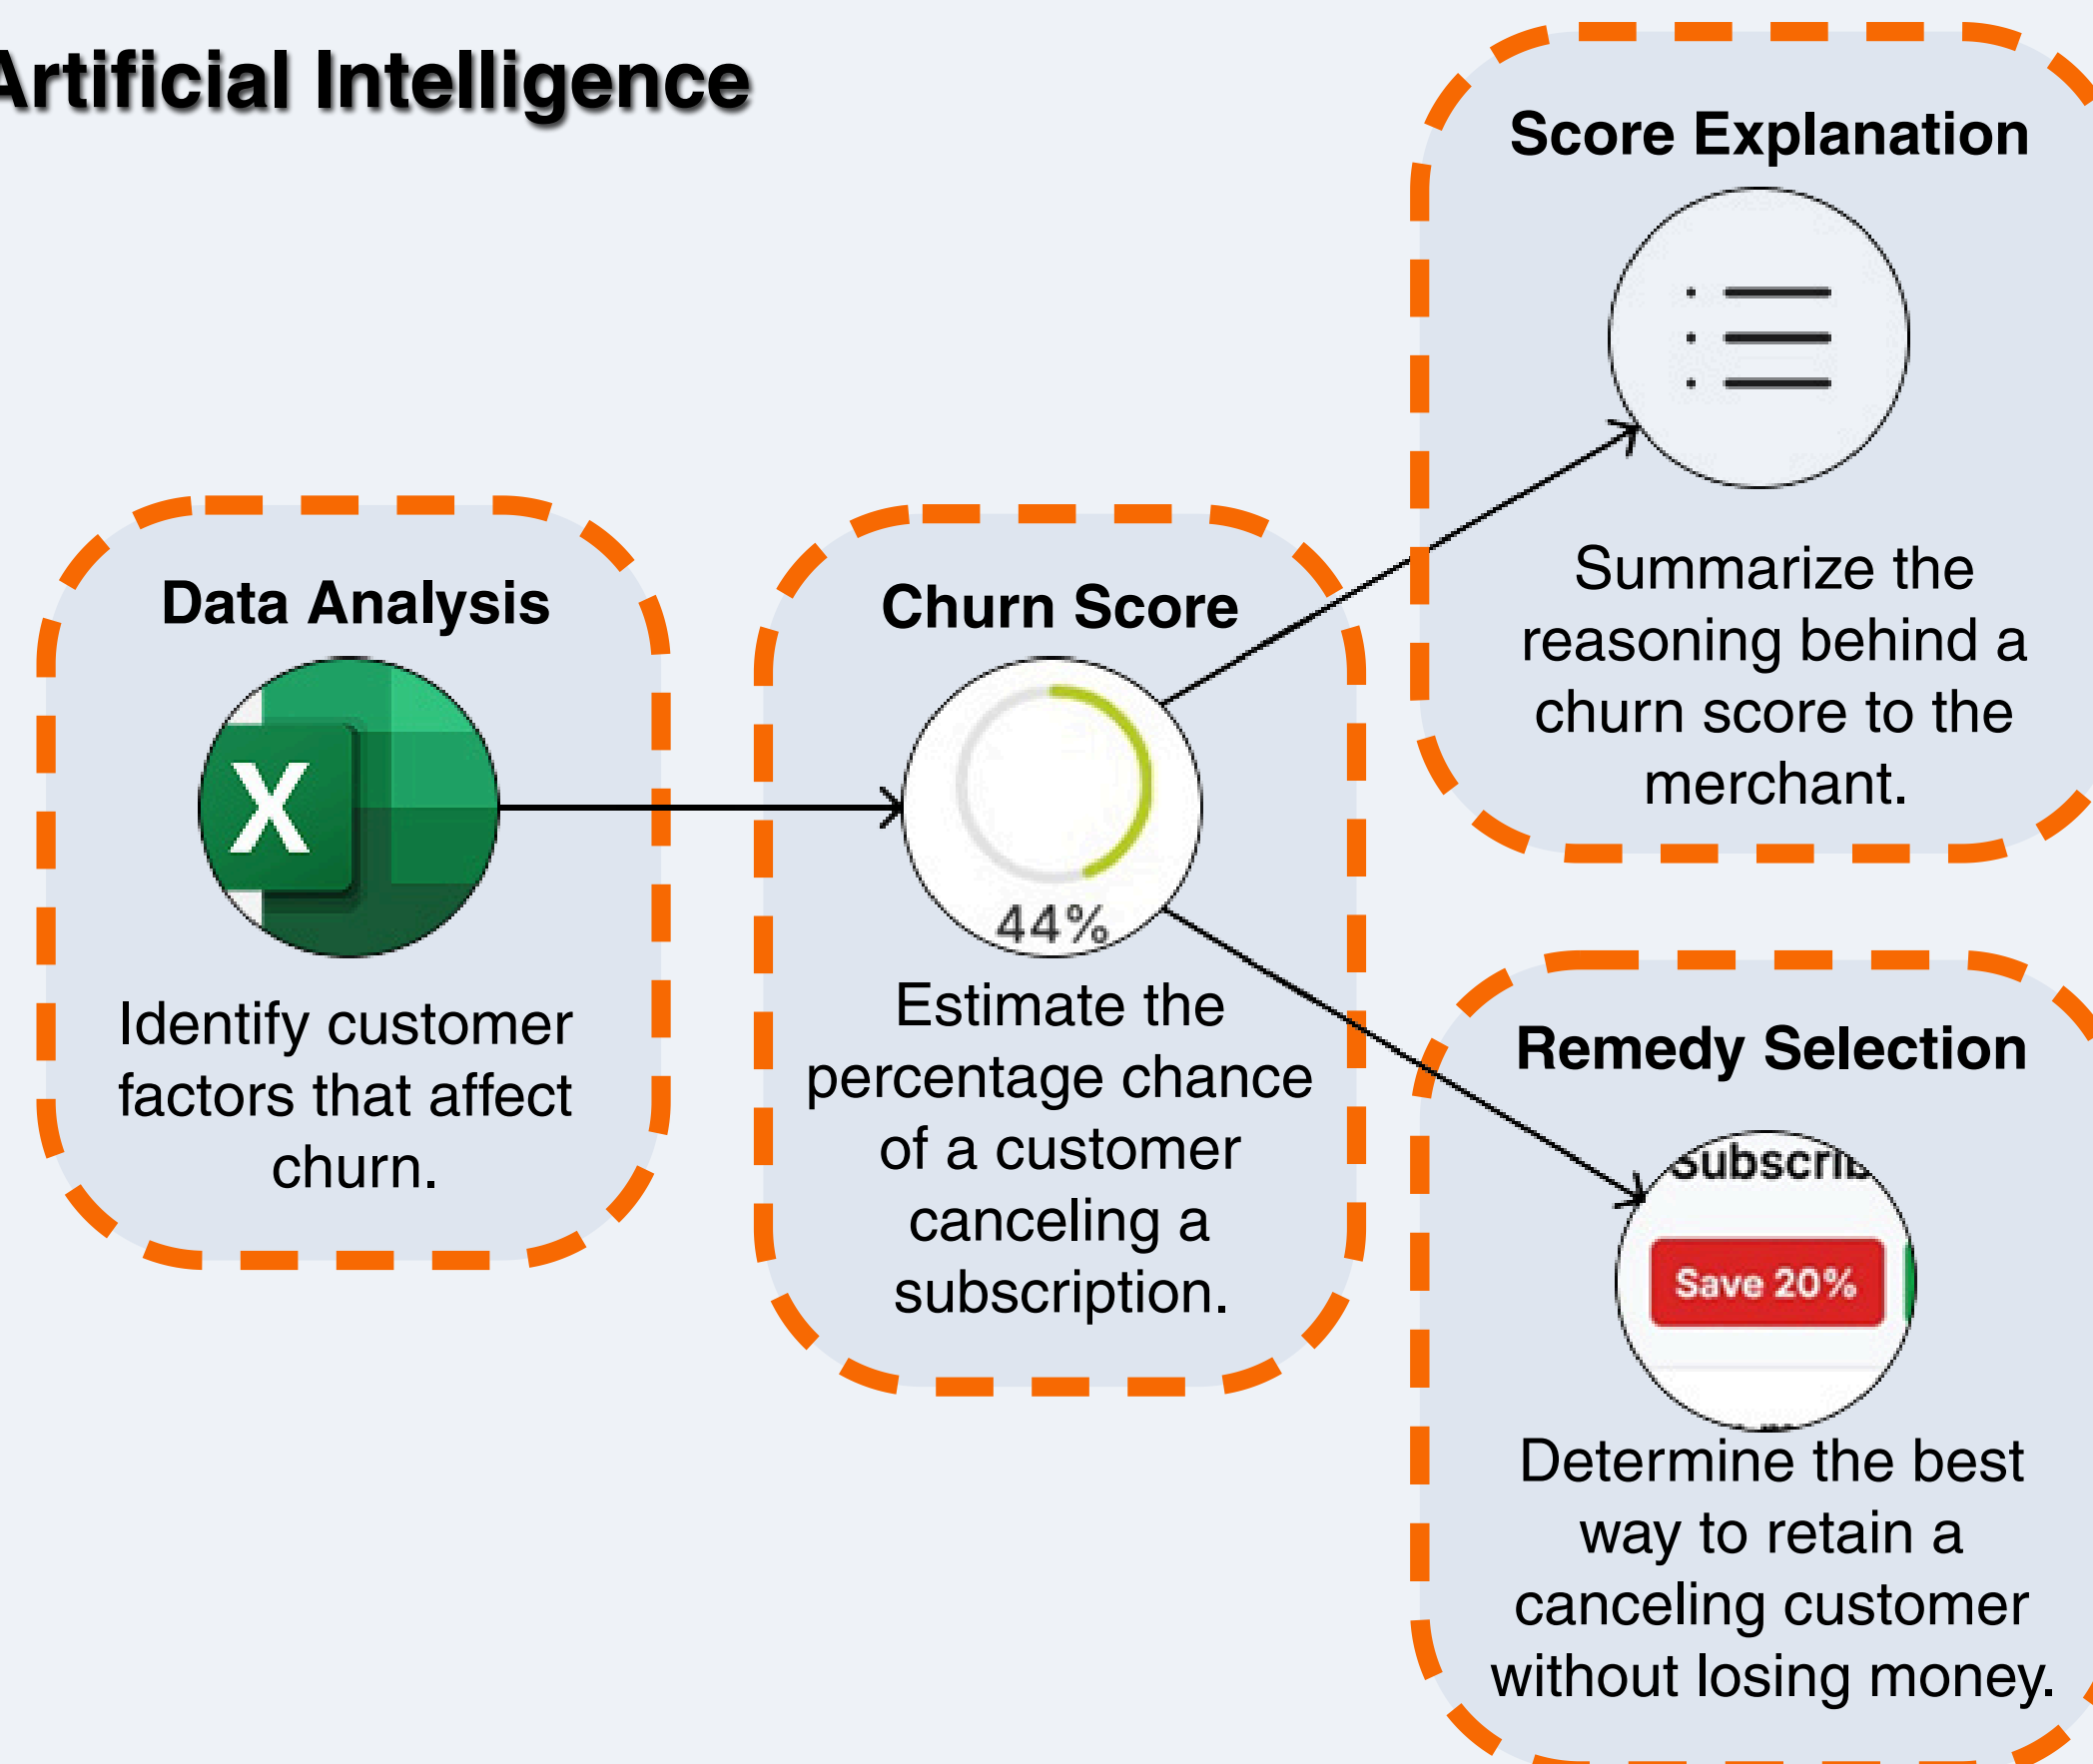

System Architecture

Frontend: React, Polaris (Shopify's UI Framework)
Backend: TypeScript, Prisma ORM
Cloud (AWS): EC2, VPC, RDS, Directory Service
Integration: Cloudflare, GraphQL, Gemini
Security: HTTPS/TLS Encryption, Demilitarized Zone

Artificial Intelligence

Accomplishments

Subscriptions Flow AI is successfully deployed to AWS via EC2 and meets all of the requirements to be listed on the Shopify App Store. Additionally, our full suite of UI tests ensures that the app adequately adheres to 100% of our initial MVP specifications

Possibilities for Growth

Win Back

The ability to retain information to contact shoppers about restoring canceled subscriptions

AI Enhancements

AI can be leveraged even more to help merchants manage their selling plans

Email Servicing

Hosting a cloud based email scheduler that supports templates

Migrations

Many merchants may already be using a similar third party app, supporting data migrations to ours would entice merchants to join
